## **DETAILED ACTION**

### ***Response to Amendment***

1. Applicant's declaration and accompanying remarks filed 4/9/03 and 4/28/03 have been entered and carefully considered. Applicant's arguments are not found persuasive of patentability for reasons set forth herein below.

### ***Claim Rejections - 35 USC § 103***

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

3. Claims 1-4, 6-13, and 15-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nemoto et al (6102465) in view of Nagata et al (6312542), as set forth in the previous three actions.

Applicant again argues that the combination set forth above does not possess the claimed tensile strength property and that it would not have been obvious to increase the tensile strength of the fabric. Applicant relies on the declaration as evidence that materials having high tensile strength have low sound absorption.

The examiner reiterates the position that even if applicant's tensile strength is not inherent in the fabric of Nemoto it would have been obvious to increase the tensile strength. Nemoto's fabric is subjected to a needling process and various needling processes alone have the capability of achieving extremely high tensile strengths, i.e. well above 150. Nemoto further employs the use of binder fibers, which also increase the tensile strength of a fabric. This combination of needling and the use of

Art Unit: 1771

binder fibers create a prima facie case of obviousness that Nemoto's fabric has a tensile strength above 150. In the alternative, it would have been obvious to the skilled artisan to modify the needling process and amount of binder fibers for the reasons previously set forth.

To rebut this finding, Applicant relies on the declaration, which concludes that increased tensile strength decreases sound absorption. However, applicant's conclusion is not commensurate with the experiments performed in the declaration. The declaration tests two different methods of binding: needling and water-jet. Therefore, the experiment does not offer reliable results because it uses two variables instead of one. In order to reach an accurate conclusion about the effect of tensile strength on sound absorption the same entanglement method must be used. Said rejection is maintained from the last action.

### ***Conclusion***

**4. THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Art Unit: 1771

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
